

Abstract of the Disclosure:

An assembly of a vibration-generating unit and a housing  
accommodating the unit includes a vibration damper. The unit  
is retained on the housing by way of at least one dampened  
5 spring configuration that is linked with the unit on the one  
hand and the housing on the other hand, each at a respective  
connecting point. The spring configuration has at least one  
single spring element that is capable of oscillating with a  
resonant frequency different from that of the single spring  
10 element.
